

UNITED STATES SPECIFICATION

TITLE: **SYSTEM FOR CREATING A PERSONALIZED FITNESS VIDEO
FOR AN INDIVIDUAL.**

FIELD OF THE INVENTION

The present invention relates to a system or method for creating a personalized fitness video for an individual and, more particularly, it relates to such a system or method whereby a fitness expert, after determining a specific fitness plan for the individual, utilizes a computer to create a video for a personalized fitness program based on the determined specific fitness plan so that the individual for whom the video is created can follow the program by playing the video and following the instructions thereof or accessing a secure web site established by the fitness expert which contains the video.

BACKGROUND OF THE INVENTION

There are at the present time a number of fitness, exercise or workout videos available on the market. Several are produced by well-known personalities, such as Jane Fonda, Denise Austin and Richard Simmons. Other such physical fitness videos include martial arts exercise videos, etc. The underlying rationale of such fitness/exercise videos is to inspire and instruct individuals in the performance of a series of exercises designed to achieve the

intended goal which is the premise of the particular video, i.e. fitness, weight loss, martial arts proficiency, etc. Thus, the fitness or exercise expert will demonstrate on the video a series of exercises with voice instructions which in that expert's opinion are generally suitable for achieving the particular goal desired. Since each such video must of necessity be addressed to a relatively wide audience without regard to any individual's physical abilities, physical needs or physical goals, a relatively large segment of the population who could potentially benefit from such a fitness/exercise program is effectively excluded. For instance, individuals with everyday problems and health issues, such as lower back problems, knee problems, high blood pressure, etc., are to a large extent precluded from participating in the exercise programs of such generic fitness/exercise videos since such generic fitness videos are incapable of addressing everyone's fitness level. Furthermore, such generic fitness/exercise videos include minimal, if any, modifications necessary to decrease the possibility of further injury to a participant with an already existing health condition or limitation.

For those individuals who wish to exercise in the privacy of their own homes and who are physically limited because of a health problem or condition and thus unable to utilize the generic fitness/exercise videos currently available, the services of a fitness expert or trainer for in-home training is required.

Obviously, the employment of such a personal trainer for one or several sessions per week is expensive and certainly not within the means of many physically limited individuals who are unable to utilize the generic fitness/exercise videos.

SUMMARY OF THE INVENTION

It is, therefore, a primary object of the present invention to provide a system whereby a fitness expert can produce a personalized fitness video for an individual which takes into account that individual's physical abilities, physical needs and physical goals.

The above object is accomplished in accordance with the present invention whereby the individual for whom the fitness video is intended is assessed by the physical fitness expert for the individual's flexibility, cardiovascular condition, body fat composition, muscular strength and endurance, and other health conditions or limitations. Based on this assessment, the physical fitness expert determines a specific fitness plan which includes a detailed workout program of specific exercises. The physical fitness expert then, by means of operations performed on a computer, selects a plurality of video segments each of which demonstrates a specific exercise of the detailed workout program in accordance with the determined specific fitness plan. These video segments are among a series of pre-recorded video segments stored

in a library memory of the central processing unit. The physical fitness expert then, by means of further operations on the computer, arranges the selected video segments into a sequence corresponding to at least one arrangement of the specific exercises according to the specific fitness plan and possibly into several different arrangements. Then, by means of a DVD burner, the physical fitness expert records the sequentially arranged selected video segments onto a digital versatile disc (DVD) which can then be utilized by the individual in his personal computer or DVD player for personalized physical fitness instruction.

For those individuals who prefer a video tape rather than a DVD, the physical fitness expert can record a videotape of the personalized fitness program from the DVD.

In addition, the physical fitness expert can upload the sequentially arranged selected video segments of the specific fitness plan for an individual onto a web site which can then be made available for downloading by the individual. When the individual has downloaded the selected video components into his or her computer, the video can be viewed on screen.

BRIEF DESCRIPTION OF THE DRAWINGS

Other objects and features of the present invention will become apparent from the following detailed description considered in connection with the accompanying drawings, in which:

FIGURE 1 is a schematic representation of the apparatus utilized in the system for producing a personalized fitness video on a digital versatile disc for an individual according to the present invention;

FIGURE 2 is a schematic representation of the production of a video cassette of the personalized fitness video from a DVD thereof; and

FIGURE 3 is a schematic representation for the use of a secure web site for accessing a personalized fitness video.

DETAILED DESCRIPTION OF THE INVENTION

Initially, the physical fitness professional will pre-record a series of video segments 1 to n utilizing a video camera, designated 10 in Figure 1. Each pre-recorded video segment of the series is a video demonstration of a specific exercise and/or variations of specific exercises. Thus, video segment 1 may demonstrate the push-up exercise, video segment 2 may demonstrate the deep knee bend, video segment 3 may demonstrate a typical warm-up exercise and so on. Included in the series of video segments 1 to n will also be video segments of exercises designed to address specific handicaps and physical problems or limitations. The recorded video segments 1 to n are recorded in the memory of a central processing unit 12 and stored therein. Subsequently, the physical fitness professional by operations performed on controller

14 and utilizing microphone 16, will insert voice over instructions as well as printed instructions on each of the video segments as necessary. Such instructions may further explain the demonstrated exercise or caution the viewer with respect to the exercise in order to avoid a possibility of injury.

The physical fitness professional can now proceed to produce a customized or personalized physical fitness video for an individual when approached to do so. First, the physical fitness professional interviews the individual desiring the personalized fitness video and assesses the individual's flexibility, cardiovascular condition, body fat composition, muscular strength and endurance. Any other health conditions or limitations that the individual may have are also taken into consideration by the physical fitness professional. Based on this assessment and taking into consideration the individual's needs and goals, the physical fitness professional determines a specific fitness plan which will include a detailed workout program of specific exercises. The fitness professional then returns to his or her computer and by utilizing controller 14 selects a video segment from the series of video segments 1 to n stored in central processing unit 12 for each specific exercise of the detailed workout program and arranges the selected video segments into one or more sequences corresponding to the specific fitness plan.

At this stage the fitness professional, utilizing microphone

16, can amend the voice over instructions associated with each selected video segment or insert totally new instructions as required for the benefit of the individual for whom the video is being created.

The resulting specific fitness plan is fixed in a file specific to the individual for whom it is created and stored in central processing unit 12 as individual file 1. Subsequent files, individual files 2 to n, corresponding to specific fitness plans for other individuals will also be stored in central processing unit 12 as those individuals are assessed and specific fitness plans developed.

By means of DVD burner 18, a digital versatile disc (DVD) fitness video, designated 20, is created from the specific individual file stored in central processing unit 12. Thus, the individual for whom the fitness video is designed may utilize a personal computer for viewing and following the specific fitness plan or he may utilize a DVD player for viewing and following the specific fitness plan. On the other hand, if the individual wishes to have a video cassette of the fitness program made, as clearly seen in Figure 2, DVD 20 is inserted into DVD player 22, to which a VCR player recorder 24 is connected and the video is recorded onto a blank video cassette resulting in a fitness video cassette 26.

Another option which can be made available to an individual for whom a specific fitness plan is developed and stored in central processing unit 12 as one of the individual files 1 to n is to permit access to the individual file via the internet. Thus, as

clearly seen in Figure 3, the fitness professional obtains a secure web site 28 from a web server and uploads, for instance, individual file 1 onto the web site which is then made available to the individual for whom the specific fitness plan of individual file 1 was developed. That individual will obtain an identification and password from the fitness professional so that he or she can download from web site 28 the video of individual file 1 into his or her computer or central processing unit 30 to be viewed on screen 32.

Subsequently, after the individual for whom the fitness video was designed has utilized the fitness video for a period of time, the physical fitness professional will reassess the individual so as to evaluate the progress made by the individual in following DVD fitness video 20, fitness video cassette 26 or secure web site 28. Based on this reassessment, the physical fitness professional may return to the file specific to this individual stored in central processing unit 12 and through controller 14 and microphone 16 make changes in the file as required. These changes may include additional specific exercises from video segments 1 to n and/or deletion from the file of certain specific exercises, changes to the voice over or printed instructions, sequence changes, etc. which, in the opinion of the physical fitness professional, are necessary or required.

It is to be understood that the foregoing general and detailed descriptions are explanatory of the present invention and are not to be interpreted as restrictive of the scope of the following claims.
